TRADELINE BUSINESS OPERATING SYSTEM

Build Workflow & Delivery Plan

A phased plan for the next round of work: staff accounts, a full KPI framework for companies and BDOs, a Senior-BDO dashboard, an Executive dashboard, a consolidated all-companies dashboard, and the payment-structure module.

Staff Accounts | KPI Framework | Senior BDO Dashboard | Executive Dashboard | All-Companies Dashboard | Payment Structure

Prepared for: BAPX & Tradeline Consult group

14 July 2026 · v1.0

1 Purpose & Scope

What this round of work delivers and how the six requests fit together.

This document turns six requested features into an ordered, buildable plan. Each item is written as a **workstream** with its current state, the target, the concrete steps, the data-model impact, and how we will know it is done. The workstreams share foundations — the roles/access model and the KPI data — so they are sequenced so earlier work unblocks later work.

#	WORKSTREAM	IN ONE LINE	DEPENDS ON
A	**Staff accounts**	Invite & manage all staff logins, not just BDOs, with the right role & company.	—
B	**KPI framework**	KPIs for every company *and* per-BDO targets vs actuals.	A
C	**Senior BDO dashboard**	A team-lead view: the Senior BDO sees their whole team's pipeline & KPIs.	A, B
D	**Executive dashboard**	A CEO/board view: group-wide revenue, KPI health, top deals & risks.	B
E	**All-companies dashboard**	Every company side by side in one comparison screen.	B, D
F	**Payment structure**	Model the payment method/schedule from the Excel sheet into the system.	—

One input needed before Workstream F. Please share the Excel sheet that describes how payments are made. The columns, stages and any formulas in it decide the data model — I do not want to guess the structure and rebuild it later.

2 Roles & Access Model

The foundation every dashboard reads from. Today there are three roles; we add one.

TODAY

Current roles

- `ADMIN` — full access, manages BDOs & users.
- `CEO` — executive read access.
- `BDO` — own dashboard, own pipeline & tasks.

A login (`User`) optionally links to a BDO profile via `bdoId`; the BDO profile carries the `company`.

PROPOSED

Add: Senior BDO

- `SENIOR_BDO` — a BDO who also leads a team within a company.
- Sees their own numbers *plus* every BDO they supervise.
- Needs a link from team members to their lead (e.g. `managerId` on the BDO profile).

Access matrix (target):

CAPABILITY	BDO	SENIOR BDO	CEO / EXEC	ADMIN
Own dashboard, pipeline & tasks	✓	✓	✓ (all)	✓
Team members' pipeline & KPIs	—	✓ (their team)	✓ (all)	✓
Company & per-BDO KPI scorecards	Own	Team	All	All
Executive / all-companies dashboards	—	—	✓	✓
Manage staff accounts & KPIs	—	—	—	✓

A Staff Accounts

Move from "invite a BDO" to "invite any staff member" with the correct role and company.

NOW

Where we are

- Admin can create `User` logins and BDO profiles.
- Roles exist (ADMIN/CEO/BDO) but the invite flow is BDO-centric.

TARGET

Where we're going

- One "Add staff" flow: name, email, **role**, **company**.
- Auto-generated temp password + forced change on first login (already supported by `mustChangePassword`).
- Senior BDO can be assigned team members.

Steps

- Add `SENIOR_BDO` to the `User.role` enum and to the invite form's role selector.
- Add `managerId` (nullable) to the BDO profile so members can point to their Senior BDO.
- Extend the Manage Users screen: filter by role & company, show status, resend invite / reset password.
- On invite, email or display the temporary credentials for hand-off.

Data model

- `User`: role enum → `['ADMIN','CEO','SENIOR_BDO','BDO']`.
- `BDO`: add `managerId: string | null`.

Done when

- [ ] Admin can create an account for any role and any of the six companies.
- [ ] A Senior BDO can be linked to the members they supervise.
- [ ] New staff are forced to set a password on first login.

B KPI Framework — Companies & BDOs

KPIs "for all" (each company) and "for each BDO" (individual targets vs actuals).

NOW

What exists

- `KpiScorecard` — monthly company KPIs, but the company enum is locked to **BAPX / TRADELINE only**.
- `MonthlyKpi` — already has `bdoId`, `metric`, `target`, `actual`: the per-BDO foundation is present but not surfaced.

TARGET

What we build

- Company KPIs for **all six** companies.
- Per-BDO KPI targets vs actuals, visible on each BDO dashboard.
- Rollups: a BDO's actuals roll up to their company; companies roll up to the group.

Steps

- Widen `KpiScorecard.company` enum to all six company keys (mirrors the fix already done for BDOs & tasks).
- Update the KPI Scorecard page filters/form to list all companies (currently hardcoded to BAPX/Tradeline).
- Build a per-BDO KPI editor on top of `MonthlyKpi` (metric, month, target, actual, notes).
- Surface per-BDO KPI tiles (target vs actual, % attainment, on-track/at-risk/off-track) on the BDO dashboard.
- Define the standard metric set once (e.g. deals won, revenue, calls/meetings, conversion) so every BDO is measured the same way.

> **Decision needed:** the standard KPI metric list. Give me the metrics you want every BDO measured on and I'll seed them so the scorecards are consistent instead of free-text.

Done when

- [ ] Company KPI scorecards can be entered for all six companies.
- [ ] Each BDO has monthly targets vs actuals visible on their dashboard.
- [ ] Attainment status (on-track / at-risk / off-track) is computed, not typed.

C Senior BDO Dashboard

A team-lead view sitting between the individual BDO view and the executive view.

What it shows — scoped to the members linked via `managerId`:

- Team pipeline: combined deals, stages, health, potential vs received revenue.
- Team KPI board: each member's target vs actual, ranked, with team totals.
- Scheme-of-work rollup: open / overdue / completed tasks across the team.
- Drill-down: click a member to open their individual dashboard.

Steps

- New route `/senior/[id]` (or reuse the BDO dashboard with a "team" tab when role is SENIOR_BDO).
- API: list deals/tasks/KPIs where the BDO's `managerId` = the senior BDO (plus the senior's own).
- Reuse existing pipeline charts & stat tiles; add a per-member leaderboard table (uses the paginated DataTable).
- Sidebar: show a "My Team" link when the logged-in user is a Senior BDO.

Done when

- [ ] A Senior BDO logs in and sees their team's combined pipeline, revenue and KPIs.
- [ ] They can drill into any team member's own dashboard.
- [ ] They cannot see other teams or other companies.

D Executive Dashboard

The CEO/board screen: the whole group on one page, at a glance.

What it shows

- Group headline tiles: total potential / received / outstanding revenue across all six companies.
- Revenue & deal trend charts over time.
- KPI health summary — how many company/BDO KPIs are on-track vs at-risk vs off-track.
- Top deals and top risks (biggest at-risk / stale deals) pulled from every pipeline.
- Per-company snapshot strip linking through to each company's detail.

Steps

- New route `/executive`, restricted to CEO/Admin.
- API aggregation endpoint that sums across BapxDeal + TradelineDeal + CompanyDeal and KPI collections.
- Build tiles + Recharts trend/health charts; reuse revenue formatting already used on pipelines.
- Add to the CEO sidebar as the landing view.

> **Note:** the current home page (`/`) is already a "CEO Dashboard." We should decide whether the Executive dashboard *replaces* it or sits alongside it as a deeper, group-wide view. My recommendation: make Executive the richer group view and keep the current page as the simpler landing.

Done when

- [ ] The CEO sees group-wide revenue, trends and KPI health without opening each company.
- [ ] Top deals and top risks surface automatically.

E All-Companies Dashboard

Every company side by side — a comparison grid rather than a single roll-up.

Where the Executive dashboard answers "how is the *group* doing?", this screen answers "how do the companies compare to *each other*?" One row (or card) per company: BAPX, Tradeline, Alpha Africa, Finance Factory, Community Finance, Akoteq.

COMPANY	ACTIVE DEALS	CLOSED WON	POTENTIAL REV.	RECEIVED	OUTSTANDING	KPI HEALTH
BAPX	…one comparison row per company, sortable & exportable…					
Tradeline						
Alpha Africa						
Finance Factory · Community Finance · Akoteq …						

Steps

- New route `/companies` (or a tab on the Executive dashboard).
- Reuse the aggregation endpoint from D, grouped by company key instead of summed.
- Comparison table (paginated/sortable DataTable) + a bar chart comparing revenue across companies.
- Each row links to that company's pipeline / dashboard.

Done when

- [ ] All six companies appear in one comparison view with revenue & KPI health.
- [ ] The view is sortable and exportable, and each row drills through.

F Payment Structure Module

Bring the payment method/schedule from the Excel sheet into the system.

The deal collections already track revenue, received amounts and outstanding balances. This workstream adds the **how** — the payment method, instalments/milestones and schedule described in your spreadsheet — so a deal's money can be tracked against a defined plan rather than a single number.

Steps (once the sheet is shared)

- Map the spreadsheet columns → a `PaymentPlan` / `PaymentSchedule` model (milestone, due date, amount, % , status).
- Attach payment plans to deals; compute received vs outstanding from the schedule.
- Optional one-time importer to load the existing Excel rows so history isn't retyped.
- Surface a payment tab on the deal / pipeline view and roll paid/overdue amounts into the dashboards above.

> **Blocked on input.** I've left this deliberately light because the model must match your actual sheet. Share it and I'll turn its columns into the exact schema and screens — that avoids a guess-and-redo cycle.

Done when

- [ ] A deal can carry a structured payment plan matching the Excel sheet.
- [ ] Received vs outstanding is computed from the schedule, not entered by hand.
- [ ] Overdue payments surface on the relevant dashboards.

9 Delivery Sequence

Ordered so each phase unblocks the next. Payment work can run in parallel once the sheet arrives.

Foundations — Staff accounts & roles — PHASE 1
Add `SENIOR_BDO`, `managerId`, and the "add any staff" flow. Everything else reads from this.

KPI framework — PHASE 2
Open company KPIs to all six companies; surface per-BDO targets vs actuals. Feeds C, D and E.

Senior BDO dashboard — PHASE 3
Team-scoped pipeline + KPI leaderboard, built on the roles and KPI data from phases 1–2.

Executive & All-companies dashboards — PHASE 4
One aggregation layer powers both: the group roll-up and the side-by-side company comparison.

Payment structure module — PARALLEL
Starts as soon as the Excel sheet is shared; results feed revenue accuracy into every dashboard above.

What I need from you to start

- **The payment Excel sheet** — unblocks Workstream F.
- **The standard BDO KPI metric list** — so scorecards are consistent (Workstream B).
- **Team structure** — which BDOs report to which Senior BDO (Workstreams A & C).
- **Executive vs current CEO page** — replace or keep alongside (Workstream D).
